Understanding your fitness metrics

Read more...

Three graphs built from your GPS heart rate data: Fitness & Fatigue, Form (TSB), and Workload Ratio (ACWR). Load is calculated using the T2minute method developed for elite rowing at the Australian Institute of Sport ([Tran et al., J Strength Cond Res, 2014](#)). Each session's time in each heart rate zone is multiplied by an intensity weight to produce a single load score in T2minutes. The tail at the right shows a 3-day decay forecast assuming no training.
